Hello guys,

It's almost a year since **ChatGPT** launched last November, I am also the first one to start using it for a lot of things and one of them was creating Software diagrams.

If you are an experienced Java developer, you know **how time-consuming and painful it is to create software diagrams on confluence pages**, especially for complex systems with many upstream and downstream systems.

This is where **you can use ChatGPT to create all kinds of diagrams**. If you are thinking about how ChatGPT can create diagrams as it only gives the text output, don't worry.

You can ask ChatGPT to output in Mermaid and other markup language which you can then convert into a visual diagram by using their respective editors like [Mermaid.Live](#) or a tool like [draw.io](#).

Here is our 3 part video series on our [YouTube channel](#) where you can learn how to create Software diagrams using CHatGPT for FREE. Don't forget to thumbs up and like our video

And, if you have any requests or questions feel free to ask, and if you haven't subscribed yet, **please subscribe now** so so that you can receive a notification when we publish new videos:

## Using ChatGPT to build System Diagrams

### Second part

## Using ChatGPT to build System Diagrams [PART 2]

### Part 3

## Using ChatGPT to build System Diagrams [PART 3]

That's all friends, **ChatGPT is an incredibly useful tool** and you should start using it now if you haven't tried it yet. Slowly you will find many more cases where you can use ChatGPT to improve your productivity. If you want to learn ChatGPT in-depth, you can also check out these [ChatGPT online courses](#) to start with.

All the best and keep learning.
